

HUMAN RIGHTS & ACADEMIC COMMUNITY POLICY

Extended reference framework for learning, research, technology and university governance

People
Dignity

Learning
Fairness

Research
Integrity

Technology
Responsibility

DOCUMENT STATUS Generated reference draft for internal demonstration and policy-design use. It is not an officially issued UET regulation, legal opinion, or substitute for applicable Vietnamese law, Vietnam National University regulations, or formally approved UET procedures.

Prepared 26-Sep-2026 | UET-VNU | Extended edition

I

Document Status and Institutional Basis

How factual institutional context and generated policy content are separated

This extended document builds on publicly available information about VNU University of Engineering and Technology and on the shorter UET human-rights reference draft previously prepared for this task. Public institutional sources describe UET as a member university of Vietnam National University, Hanoi, with a mission focused on high-quality human-resource development, advanced science and technology, and contribution to a knowledge society. UET also publishes the core values High quality, Innovation, Partnership and Humanity and the action slogan “Creative Thinking for the Future.”

The Student Handbook publicly emphasizes respectful conduct, compliance with regulations, appropriate behavior, protection of shared property and responsible use of communication channels. UET also publishes student-facing information on academic planning, scholarships, employment, accommodation, health-related services, internships, exchange opportunities, tuition and support policies. These public facts provide the institutional basis for the tone and priorities of this draft.

Important distinction between source-based facts and generated provisions

- Statements about UET mission, vision, core values and general student-support themes are based on public UET sources.
- Detailed workflows, control expectations, investigation principles, AI governance language, metrics, checklists and scenario responses in this document are generated policy-design proposals unless an official rule is explicitly cited.
- Where an official VNU or UET regulation differs from this draft, the official regulation prevails.
- Units using this document as a template should replace generated provisions with approved responsibilities, time limits, contact points and legal references before formal issuance.

POLICY DESIGN RULE This document intentionally avoids inventing named offices, mandatory numerical deadlines, disciplinary penalties or official contact addresses that have not been verified. Generated content is framed as “should,” “may,” or “recommended” practice unless a higher-level rule is known to require otherwise.

II

Contents and Framework Map

Thirty policy modules plus practical annexes

- 01 Purpose, Principles and Policy Objectives
- 02 Scope, Application and Key Definitions
- 03 Equal Dignity, Non-Discrimination and Inclusion
- 04 Respectful Conduct, Anti-Harassment and Anti-Bullying
- 05 Freedom from Coercion, Exploitation and Retaliation
- 06 Academic Freedom, Expression and Association
- 07 Student Rights and Responsibilities
- 08 Teaching, Supervision and Mentoring Standards
- 09 Fair Assessment, Examination and Academic Appeals
- 10 Academic Integrity, Authorship and Original Work
- 11 Research Ethics and Responsible Scientific Practice
- 12 Human Participants, Consent and Vulnerable Groups
- 13 Data Protection, Privacy and Confidentiality
- 14 Responsible Artificial Intelligence and Emerging Technology
- 15 Cybersecurity, Digital Identity and Online Conduct
- 16 Accessibility and Reasonable Accommodation
- 17 Health, Safety, Laboratory and Fieldwork
- 18 Workload, Employment and Professional Development
- 19 Student Support, Wellbeing and Financial Access
- 20 Research Collaboration, Intellectual Property and Publication
- 21 International Partnership, Mobility and Visiting Activities
- 22 Sustainability, Environment and Responsible Use of Resources
- 23 Procurement, Service Providers and External Partners
- 24 Reporting, Complaints and Protection from Retaliation
- 25 Review, Investigation, Corrective Action and Appeal
- 26 Governance, Roles and Accountability
- 27 Training, Communication and Awareness
- 28 Records, Document Control and Information Access
- 29 Monitoring, Metrics and Continuous Improvement
- Annex A** Case Scenarios and Expected Responses
- Annex B** Implementation Checklist and RACI Guidance

Final section Source basis, document control and adoption notes

HOW TO USE For training, read Sections 1-6 first, then the role-specific modules relevant to your work. For implementation, begin with Sections 26-30 and Annex B, then map the relevant specialist controls from Sections 7-25.

1

Purpose, Principles and Policy Objectives

A rights-aware framework for a technical research university

This policy framework defines the standards of dignity, fairness, academic responsibility and accountable governance expected across the UET academic community. It is designed for a research-intensive engineering and technology environment in which teaching, laboratories, software systems, research data, student activities, external collaboration and emerging technologies interact every day. The framework translates institutional values into operational expectations without replacing applicable law, Vietnam National University regulations, or formally issued UET rules.

Core expectations

- Place human dignity and educational opportunity at the center of academic and administrative decisions.
- Protect intellectual freedom while requiring evidence, professional conduct, research integrity and respect for the rights of others.
- Use transparent criteria for admission, assessment, supervision, employment, access to resources and participation in University activities.
- Identify foreseeable safety, privacy, security, accessibility and misuse risks before deploying technology or conducting research.
- Provide clear routes for questions, feedback, complaints, appeal and corrective action, with safeguards against retaliation.

Implementation and decision practice

Implementation should be practical rather than symbolic. Each faculty, institute, laboratory, project and administrative unit should understand which parts of this framework apply to its work, assign responsible roles, maintain proportionate records and integrate the expectations into routine processes such as course design, laboratory induction, research review, student support and procurement. Where requirements conflict, the responsible unit should escalate the matter rather than improvising a solution that weakens safety, fairness or due process.

Control objective

The desired outcome is a university environment in which high performance and humane treatment reinforce one another: people can learn and create ambitiously because expectations are clear, risks are managed, decisions are explainable and concerns can be raised early.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

2

Scope, Application and Key Definitions

Who is covered, where the framework applies, and how terms are used

The framework applies to undergraduate and graduate students, lecturers, researchers, professional and administrative staff, visiting scholars, interns, volunteers, contractors, research participants, invited guests and partner personnel when they participate in activities organized by, hosted by, or formally connected with UET. Coverage extends to classrooms, laboratories, offices, online learning platforms, repositories, fieldwork, competitions, conferences, exchange programs, student organizations, recruitment activities and partner sites used for University work.

Core expectations

- “Community member” means any person participating in an activity under the scope above.
- “Academic decision” includes admission, assessment, progression, supervision, research participation, authorship, resource allocation and disciplinary outcomes.
- “Personal data” means information relating to an identified or reasonably identifiable person, including academic records, identifiers, images, contact details and sensitive research data.
- “Retaliation” means disadvantage imposed because a person asked a question, raised a concern, assisted a review or used an authorized reporting process in good faith.
- “Reasonable accommodation” means a feasible adjustment that improves access while preserving essential academic, safety and professional requirements.

Implementation and decision practice

A unit should determine applicability based on the substance of the activity, not merely its physical location. For example, a project conducted on an external platform, a remote internship supervised by University personnel, or a collaborative dataset hosted by a partner can still require UET-side controls. Units should document exceptions when necessary and identify the formal rule that authorizes the exception.

Control objective

This is a generated reference framework. Terms are intended to support consistent internal discussion and should not be interpreted as creating legal rights beyond those established by applicable law and official University instruments.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

3

Equal Dignity, Non-Discrimination and Inclusion

Fair access to learning, research, work and participation

Every person should be treated as a member of an academic community whose dignity does not depend on academic rank, job title, economic background, disability, gender, age, nationality, ethnicity, belief, family status or other irrelevant personal characteristic. Decisions must use legitimate academic, professional, safety or operational criteria. Inclusion does not require identical treatment in every situation; it requires comparable respect, objective reasons for differences and a willingness to remove avoidable barriers.

Core expectations

- Publish eligibility and selection criteria before high-impact competitions, scholarships, research positions or special programs whenever feasible.
- Avoid informal gatekeeping in which access depends primarily on personal connections, unrecorded preferences or information available only to a small group.
- Use accessible formats and communication channels when barriers are known or reasonably foreseeable.
- Separate performance feedback from personal attacks, humiliation, stereotyping or comments unrelated to the work being assessed.
- Review patterns of exclusion or repeated complaints at unit level, even when individual incidents appear minor in isolation.

Implementation and decision practice

When a decision may significantly affect an individual, the responsible unit should be able to explain the relevant criteria and the evidence considered. Records need not expose confidential information about other people, but they should be sufficient to demonstrate that the decision was not arbitrary. Selection panels and supervisors should disclose conflicts of interest and avoid participating where impartiality cannot reasonably be maintained.

Control objective

Inclusive practice is especially important in interdisciplinary engineering environments because teams often mix different technical backgrounds and levels of experience. The goal is not to reduce standards, but to ensure that standards are visible, relevant and applied consistently.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

4

Respectful Conduct, Anti-Harassment and Anti-Bullying

A professional environment for study, work and collaboration

Harassment, bullying, intimidation, humiliating treatment, sexual harassment, threats, stalking, repeated hostile conduct and deliberate social exclusion can undermine safety and academic participation even when they do not occur in a formal classroom or office. The University community should maintain professional boundaries across face-to-face interactions, email, messaging platforms, social networks, research groups, student clubs, events and travel connected with University activities.

Core expectations

- Do not use academic authority, grading power, supervision, employment influence or control of resources to pressure another person into personal, romantic, financial or unrelated favors.
- Do not circulate degrading images, private messages, fabricated allegations or targeted ridicule about a community member.
- Use criticism that addresses work, evidence, methods and conduct rather than attacking a person's worth or identity.
- Stop behavior when a reasonable boundary is communicated, unless a formal academic or safety requirement clearly requires further contact.
- Leaders should intervene when hostile group dynamics are visible instead of waiting for a formal complaint if immediate preventive action is possible.

Implementation and decision practice

Informal resolution may be appropriate for low-risk misunderstandings when all parties agree and there is no serious power imbalance. Serious allegations, repeated behavior, threats, sexual misconduct or retaliation require a more formal route with documented triage and protective measures. Confidentiality should be respected, but a promise of absolute secrecy should not be made when safety or due-process duties require limited disclosure.

Control objective

A respectful culture still permits disagreement. Strong technical criticism, demanding academic standards and rigorous debate are compatible with this framework when they remain relevant, proportionate and professionally expressed.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

5

Freedom from Coercion, Exploitation and Retaliation

Participation should be informed, lawful and genuinely voluntary where choice is promised

Academic environments contain natural power differences: lecturer and student, principal investigator and junior researcher, manager and staff member, organizer and volunteer. These relationships must not be used to obtain unpaid labor, personal services, authorship concessions, political or commercial support, confidential information or participation in unrelated activities through threats or implied academic disadvantage. Where participation is mandatory, the requirement should be grounded in an official academic, safety or employment rule and communicated clearly.

Core expectations

- Do not threaten grades, references, funding, access to supervision or employment opportunities to secure personal benefits.
- Volunteer activities should be described honestly, including expected time, responsibilities, risks and whether compensation or academic credit is available.
- Research assistants and students should know when a task forms part of their academic or employment role and when it is optional.
- No person should be penalized for using an authorized complaint, appeal, whistleblowing or safety-reporting channel in good faith.
- Project leaders should identify power imbalances during fieldwork, travel, accommodation arrangements and externally funded collaborations.

Implementation and decision practice

When a person raises a concern about coercion or retaliation, the receiving unit should first evaluate immediate risks: academic deadlines, access to supervision, laboratory entry, financial dependency, visa or exchange status, and control of data or equipment. Temporary arrangements may be needed to preserve the person's ability to continue study or work while the matter is reviewed.

Control objective

Retaliation can be subtle, such as unexplained exclusion from meetings, denial of previously available resources, hostile references or sudden changes in supervision. Patterns should therefore be assessed using timelines and objective records rather than relying only on isolated statements.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

6

Academic Freedom, Expression and Association

Freedom to inquire is paired with responsibility for evidence and conduct

A university of engineering and technology depends on the freedom to question assumptions, compare competing hypotheses, publish results, critique methods and explore difficult ideas. Community members should be able to pursue lawful academic inquiry and participate in scholarly or student associations without improper interference. Academic freedom is not a license to fabricate evidence, reveal confidential data, harass others, bypass safety controls or present personal opinion as an institutional position without authorization.

Core expectations

- Distinguish clearly between personal views, research findings, teaching content and official University statements.
- Allow reasoned disagreement in classrooms and seminars while enforcing rules against disruption, threats, harassment and disclosure of protected information.
- Protect legitimate negative results and technically justified dissent from pressure to conform to a preferred outcome.
- Permit lawful academic collaboration and association, subject to conflict-of-interest, security, export, intellectual-property and research-ethics requirements where applicable.
- Use content restrictions only when they are connected to a legitimate academic, legal, safety or operational purpose and can be explained.

Implementation and decision practice

Course instructors may set relevance, evidence and conduct expectations appropriate to the learning objectives. Research leaders may define project scope and publication procedures. These managerial or academic functions should not be used to suppress criticism of methods, safety, data integrity or authorship practices. Where disagreement concerns a formal requirement, the responsible unit should identify the rule and available review path.

Control objective

The strongest protection for academic freedom is a culture in which conclusions can be challenged through transparent evidence and reproducible reasoning rather than hierarchy alone.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

7

Student Rights and Responsibilities

Clear expectations for learning, participation and community conduct

Students should receive timely, understandable information about curricula, learning outcomes, academic calendars, assessment methods, progression requirements, fees or charges, support services and channels for questions. They should have access to learning and research opportunities according to published criteria and be treated fairly in academic and administrative processes. At the same time, students are expected to meet academic requirements, maintain integrity, respect others, protect shared resources and comply with safety and information-security rules.

Core expectations

- Attend required learning activities and meet deadlines unless an approved exception applies.
- Use University systems, facilities and equipment for legitimate educational, research or authorized community purposes.
- Carry out individual and group work honestly; disclose assistance, tools and sources when required by the course or task.
- Communicate respectfully with classmates, teaching staff, support staff, research participants and external partners.
- Raise problems early through academic advising, student-support, safety or complaint channels rather than allowing avoidable issues to escalate.

Implementation and decision practice

Student participation in governance and feedback should be meaningful. Surveys, class representatives, dialogue sessions and consultation mechanisms should collect issues in a way that allows trends to be identified and assigned to responsible units. Feedback should not be treated as a popularity contest: decisions may still reflect academic standards, resource limits and legal obligations, but the reasoning should be communicated where possible.

Control objective

Students also have a responsibility to protect the learning environment. Recording, sharing or publishing class material, private conversations, images, datasets or assessment content should follow applicable rules and consent requirements.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

8

Teaching, Supervision and Mentoring Standards

Authority should support learning, independence and professional growth

Lecturers, supervisors and mentors exercise significant influence over students and early-career researchers. Good supervision sets clear expectations, gives timely technical feedback, distinguishes required work from optional opportunities, and progressively supports independent judgment. It also recognizes that mistakes can be part of learning while maintaining firm standards for integrity, safety and professional conduct.

Core expectations

- Provide a clear description of expected outputs, meeting cadence, communication channels and major milestones at the beginning of a course, thesis or research assignment.
- Give feedback that is specific enough for the learner to improve; avoid unexplained rejection, public humiliation or shifting requirements without academic reason.
- Discuss authorship, data ownership, code repositories, equipment access and publication plans early in research projects.
- Avoid conflicts between supervisory authority and personal, financial or commercial interests; disclose unavoidable conflicts.
- Escalate persistent non-performance, safety risks or integrity concerns through documented procedures rather than informal punishment.

Implementation and decision practice

Supervisors should maintain a reasonable record of important decisions, especially changes to thesis scope, evaluation criteria, research methods, publication plans or access to project resources. This protects both the learner and the supervisor when memories differ later. Students should be encouraged to summarize agreed actions after meetings for long-running projects.

Control objective

Mentoring is broader than task management. Where feasible, supervisors should help learners understand professional standards, research ethics, career options and how to evaluate technical trade-offs. Mentoring must not create a private obligation of loyalty that overrides formal academic processes.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

9

Fair Assessment, Examination and Academic Appeals

Evaluation should be transparent, consistent and reviewable

Assessment is one of the most consequential forms of academic decision-making. Students should know what knowledge or skill is being assessed, the permitted resources, submission requirements and the main grading criteria. Examinations and project evaluations should be designed to measure learning outcomes rather than hidden assumptions. Where judgment is necessarily qualitative, markers should use shared criteria or moderation practices appropriate to the importance of the assessment.

Core expectations

- Publish or communicate assessment rules before submission whenever practical.
- Apply penalties for late work, unauthorized assistance or misconduct through known procedures rather than ad hoc negotiation.
- Protect examination materials and student submissions from unauthorized disclosure or tampering.
- Use second marking, moderation or panel review for high-stakes decisions where required by formal rules or where significant inconsistency is identified.
- Provide a route to question clerical errors, procedural irregularity or alleged unfair treatment without turning an academic appeal into a demand for a preferred grade.

Implementation and decision practice

Appeals should distinguish between disagreement with academic judgment and evidence that a process was not followed correctly. Reviewers should have access to the relevant records while avoiding unnecessary exposure of other students' work. Deadlines should be clear, but units should have discretion to consider late submissions when serious circumstances are documented.

Control objective

Assessment data can also reveal systemic issues. Unusual failure patterns, large differences between sections, repeated complaints or abrupt grading changes should trigger academic review rather than being dismissed automatically as individual dissatisfaction.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

10

Academic Integrity, Authorship and Original Work

Trustworthy scholarship requires traceable contributions and honest representation

Academic integrity requires that submitted work accurately represents what a student or researcher has done, what assistance was received, which sources were used and how evidence was produced. Misconduct may include plagiarism, fabrication, falsification, unauthorized collaboration, impersonation, manipulation of assessment systems, deceptive reuse of prior work, or deliberate concealment of material conflicts. The exact classification and consequence must follow applicable academic regulations.

Core expectations

- Cite sources and prior work in the form required by the discipline or course.
- Do not invent experimental results, participants, references, measurements, code outputs or evaluation metrics.
- Do not claim authorship or major contribution when the contribution does not justify it, and do not exclude contributors for improper reasons.
- Preserve raw data, analysis code, laboratory notes or other evidence when required for verification and reproducibility.
- Disclose use of generative AI or automated tools when the course, journal, supervisor or research protocol requires disclosure.

Implementation and decision practice

Responsible authorship should be discussed before submission, especially in interdisciplinary projects where contributions may include data collection, hardware design, software implementation, statistical analysis, conceptualization and writing. Disputes should be addressed using contribution evidence rather than seniority alone. Acknowledgment may be appropriate when a contribution is valuable but does not meet authorship criteria.

Control objective

Integrity education should focus on practice, not only punishment. Students and researchers should learn how to paraphrase, cite, maintain reproducible workflows, manage versions, document experiments and ask for clarification when rules are uncertain.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

11

Research Ethics and Responsible Scientific Practice

Research quality includes integrity, safety, transparency and social responsibility

Research at a technical university can create significant benefits and significant risks. Responsible practice begins before data collection: researchers should define the question, justify the method, assess safety and privacy, consider conflicts of interest, plan data management, and determine whether specialized ethical or institutional review is required. Projects should not be structured so that deadlines or publication pressure make misconduct the easiest way to succeed.

Core expectations

- Use methods appropriate to the research question and document material deviations from the approved plan.
- Record negative, unexpected or null findings honestly instead of selectively removing results solely because they are inconvenient.
- Identify and manage financial, supervisory, personal or institutional conflicts that could affect interpretation or participant protection.
- Respect intellectual contributions, research materials, licenses and conditions attached to datasets, software and equipment.
- Report serious errors discovered after publication or dissemination and cooperate with appropriate correction processes.

Implementation and decision practice

Research groups should establish reproducible practices proportionate to their field. Examples include version-controlled code, dated laboratory notebooks, calibration records, data dictionaries, model cards, experiment manifests and review of critical analysis scripts. These practices improve both research integrity and engineering reliability.

Control objective

Leaders should create an environment in which a junior researcher can question an unsafe protocol or inconsistent result without being treated as disloyal. Independent verification is a strength, not an obstacle to productivity.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

12

Human Participants, Consent and Vulnerable Groups

Additional safeguards apply when research directly affects people

Research involving people, identifiable personal data, behavioral observation, medical or biometric information, interviews, user studies or interventions should be designed around respect, informed participation and proportionate risk. Participants must receive information appropriate to the study and should understand what is being collected, why it is needed, what participation involves, and what choices they have. Where consent is not the applicable legal or ethical basis, the research team should document the alternative basis and required safeguards.

Core expectations

- Use clear participant information and avoid technical language that obscures material risks.
- Do not recruit students or subordinates in a way that makes participation appear necessary for grades, supervision, employment or access to services.
- Collect only the data reasonably needed for the study and separate identifiers from research data where feasible.
- Apply enhanced safeguards for minors, people with limited decision-making capacity, people under institutional authority and groups exposed to social or economic vulnerability.
- Plan how participants can ask questions, withdraw where applicable, and report unexpected problems.

Implementation and decision practice

Compensation should reimburse time or inconvenience without becoming an excessive inducement relative to the context. Recording of audio, video, screens or biometric signals requires explicit attention because such data can be difficult to anonymize. Researchers should also consider downstream uses: future model training, public datasets, demonstrations, cross-border transfers and secondary analysis.

Control objective

Consent is a process rather than a signature alone. Material changes to a study may require renewed communication or approval before the new procedure is used.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

13

Data Protection, Privacy and Confidentiality

Collect less, control access, document purpose and reduce avoidable exposure

Academic and administrative systems may contain student records, research data, identifiers, contact information, images, access logs, financial information and other sensitive materials. Privacy protection starts with purpose limitation: data should be collected because it is needed for a defined educational, research, safety or administrative function. Convenience alone is not a sufficient reason to gather or retain personal information indefinitely.

Core expectations

- Classify data by sensitivity and apply stronger controls to higher-risk categories.
- Use role-based access so people can reach only the records needed for their duties.
- Avoid sharing confidential information through public links, personal repositories, unsecured messaging groups or unmanaged devices.
- Set retention periods or review dates and remove data that no longer has a legitimate purpose, subject to formal recordkeeping obligations.
- Assess privacy risks before publishing datasets, screenshots, logs, recordings or examples that may indirectly identify individuals.

Implementation and decision practice

Research teams should maintain a data-management plan for projects with significant personal or confidential data. The plan should identify data owners, storage locations, access rules, backup, encryption where appropriate, sharing conditions, retention and secure disposal. Administrative units should use similar principles for operational records.

Control objective

Privacy incidents should be reported promptly through the designated route. Early reporting allows passwords, access permissions, public links or compromised devices to be addressed before exposure grows. The objective is rapid containment and learning, not concealment.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

Responsible Artificial Intelligence and Emerging Technology

Innovation should remain explainable, secure, lawful and human-accountable

Artificial intelligence, autonomous systems, robotics, large language models, computer vision and data-driven decision systems can accelerate research and education, but they can also introduce hallucinated content, bias, privacy leakage, insecure code, over-automation and unclear accountability. UET community members should treat AI outputs as generated artifacts that require human judgment, validation and context rather than as authoritative answers by default.

Core expectations

- Verify factual, mathematical, legal, safety-critical and research claims before relying on AI-generated output.
- Do not upload confidential, unpublished, personal or restricted data to external AI services unless the use is authorized and appropriate safeguards exist.
- Document material AI use in research, assessment or decision support when reproducibility, authorship or accountability could be affected.
- Test systems for failure modes relevant to their use, including false positives, false negatives, bias, prompt injection, model drift and unsafe automation.
- Keep a responsible human decision-maker for high-impact academic, safety, disciplinary or personnel decisions.

Implementation and decision practice

AI-supported assessment or administrative triage should not silently become the sole basis for an adverse decision. Where automated systems meaningfully influence outcomes, units should know what data is used, what the tool can and cannot infer, and how a person can request review. Research prototypes should be clearly distinguished from production services.

Control objective

Responsible innovation does not mean avoiding experimentation. It means designing experiments with boundaries, logging, evaluation, rollback plans and explicit ownership of risk.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

15

Cybersecurity, Digital Identity and Online Conduct

Protect systems, credentials, research assets and the integrity of communication

Cybersecurity is part of academic responsibility because compromised accounts or systems can expose personal data, research results, examination materials and infrastructure. Community members should protect credentials, use approved authentication mechanisms, keep devices reasonably updated, and report suspicious activity promptly. Technical curiosity should never be used as a justification for unauthorized access to systems or data.

Core expectations

- Do not share passwords, authentication tokens, private keys or reusable access codes.
- Use least-privilege access for repositories, cloud services, laboratories and administrative systems.
- Do not run security testing against University or partner systems without explicit authorization and a defined scope.
- Review dependencies, secrets, public repositories and cloud permissions before publishing or deploying software.
- Treat phishing, credential theft, malware, exposed secrets and unexplained account activity as incidents that require prompt reporting.

Implementation and decision practice

Online conduct should also protect institutional trust. Users should avoid impersonating official units, fabricating notices, publishing private records, or using University systems for harassment or fraud. Administrators of clubs, laboratories and project channels should manage access when people change roles or leave a project.

Control objective

For research on cybersecurity, malware, vulnerability discovery or offensive techniques, project leaders should define containment, data handling, authorization and responsible-disclosure expectations before risky experiments begin.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

16

Accessibility and Reasonable Accommodation

Design learning and participation so avoidable barriers are reduced

Accessibility benefits students, staff and visitors with permanent, temporary or situational limitations. A technical university should consider accessibility in classrooms, digital services, learning materials, examinations, events, laboratories and communication. Adjustments should be determined case by case, balancing the person's needs with essential learning outcomes, safety requirements and available resources.

Core expectations

- Provide digital documents with readable structure, meaningful headings and sufficient contrast when practical.
- Offer alternative formats or communication methods when a known barrier prevents effective access.
- Plan accessible participation for events, laboratories and field activities early rather than treating accommodation as a last-minute exception.
- Keep essential academic requirements distinct from traditions or formats that are convenient but not necessary.
- Handle disability or health-related information confidentially and share only what is needed to implement the approved support.

Implementation and decision practice

An accommodation process should identify the barrier, the essential requirement and feasible adjustments. The person requesting support should not be required to repeatedly disclose sensitive information to multiple people when a responsible unit can coordinate the necessary implementation. Staff should receive enough information to apply the adjustment without being given unrelated personal details.

Control objective

Accessibility should increasingly be built into standard design. Captions, readable materials, keyboard-accessible systems, clear instructions and flexible digital workflows often improve learning for the entire community.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

17

Health, Safety, Laboratory and Fieldwork

No academic outcome justifies unmanaged physical or operational risk

Engineering education and research may involve electricity, chemicals, machinery, high temperatures, pressure systems, lasers, batteries, vehicles, drones, biological materials, fabrication tools and field environments. Each activity should be planned with a level of risk control proportionate to the potential harm. Training and supervision are especially important when students are learning unfamiliar equipment or procedures.

Core expectations

- Complete required safety induction before using restricted laboratories, equipment or materials.
- Use protective equipment and engineering controls specified for the activity; do not bypass interlocks or safeguards for convenience.
- Maintain equipment, calibration and inspection records when failure could create significant risk or invalidate results.
- Stop work and notify the responsible person when conditions materially differ from the approved setup or an immediate hazard is identified.
- Plan emergency response, communications and supervision for fieldwork, off-site testing and activities outside normal operating hours.

Implementation and decision practice

Near misses should be reported and reviewed because they often reveal weak controls before serious injury occurs. Reviews should focus on system improvement as well as individual behavior: unclear procedures, inadequate training, poor workspace design, schedule pressure and equipment maintenance can all contribute to incidents.

Control objective

Safety requirements apply to software-controlled physical systems as well. Robotics, autonomous vehicles, power electronics and remote actuation should include fail-safe behavior, access control and testing boundaries appropriate to the hazards.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

Workload, Employment and Professional Development

Performance expectations should be clear, sustainable and professionally managed

Academic and professional work can involve periods of high intensity, especially around examinations, grant deadlines, conferences and major system releases. Exceptional effort may sometimes be necessary, but recurring overload should not become the default operating model. Managers and project leaders should plan workloads, define priorities, allocate responsibilities and surface resource constraints early.

Core expectations

- Communicate core responsibilities, deliverables and decision authority for each role.
- Avoid assigning incompatible deadlines without identifying which work takes priority.
- Use overtime or exceptional work arrangements consistently with applicable rules and avoid coercive pressure.
- Provide fair access to professional development, technical training, mentoring and opportunities relevant to role performance.
- Review repeated turnover, burnout indicators, safety incidents or quality failures as possible signs of workload or management problems.

Implementation and decision practice

Performance feedback should be evidence-based and should distinguish between capability gaps, resource constraints, unclear requirements and misconduct. Development plans should include practical actions and review points rather than vague criticism. People should know who can clarify responsibilities when instructions from different leaders conflict.

Control objective

Professional development is part of institutional quality. Training in research methods, pedagogy, laboratory safety, cybersecurity, data protection, project management and responsible AI can reduce risk while improving academic output.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

19

Student Support, Wellbeing and Financial Access

Support systems help students remain able to learn and participate

Students may encounter academic difficulty, financial pressure, health concerns, family responsibilities, housing problems, disability-related barriers or uncertainty about careers. The University should maintain clear routes to advising and support, while respecting privacy and avoiding unnecessary collection of sensitive information. Support does not remove academic standards; it helps students understand options and use formal procedures when circumstances affect their ability to meet those standards.

Core expectations

- Publish where students can obtain academic advising, administrative guidance, scholarship information, health-related support and career services.
- Use transparent criteria for scholarships, financial assistance and competitive support programs where institutional discretion is involved.
- Train front-line staff to route complex cases instead of giving speculative or contradictory advice.
- Avoid public discussion of a student's financial, health, disciplinary or family circumstances without a legitimate need.
- Coordinate support when multiple units are involved so students are not repeatedly redirected without an owner for the case.

Implementation and decision practice

When a student is at immediate risk of harm or unable to participate safely, staff should follow emergency and safeguarding procedures rather than treating the matter as an ordinary academic problem. For non-emergency difficulties, the focus should be on practical options such as advising, approved extensions, temporary adjustments or referral to the responsible service.

Control objective

Students should also be encouraged to seek help early. Clear communication reduces the likelihood that manageable issues become academic failure or conflict.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

Research Collaboration, Intellectual Property and Publication

Contributions, ownership, access and dissemination should be agreed early

Collaborative research often crosses faculties, institutions and countries and may combine software, datasets, hardware prototypes, confidential information and external funding. Projects should clarify roles, decision authority, expected contributions, intellectual-property conditions, licensing, publication review and access to shared resources before disputes arise. The exact ownership of outputs must follow applicable agreements and regulations.

Core expectations

- Record major project roles, data owners, repository administrators and persons authorized to approve external release.
- Discuss authorship and contribution criteria early and revisit them when responsibilities change.
- Respect licenses, confidentiality obligations, third-party datasets and restrictions attached to funded research.
- Do not delay or suppress legitimate publication solely to control credit, while allowing reasonable review for confidentiality, intellectual property and security.
- Preserve enough evidence of contributions and decisions to resolve later disputes fairly.

Implementation and decision practice

Student and early-career contributions deserve the same principled treatment as senior contributions. Conversely, honorary authorship can distort accountability and should be avoided. When a project produces software or datasets, maintainers should identify version, license, documentation and known limitations before external release.

Control objective

Collaboration agreements should also define what happens when a person leaves a project: continued data access, transfer of equipment, repository ownership, unfinished manuscripts and obligations to protect confidential material.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

International Partnership, Mobility and Visiting Activities

Cross-border work requires clarity on expectations, safety and institutional responsibility

International exchange, joint research, visiting appointments and overseas fieldwork can expand academic opportunity but also introduce unfamiliar legal, cultural, safety, data-transfer and administrative requirements. The responsible unit should ensure that participants receive practical information about the program, host expectations, academic responsibilities, supervision, emergency contacts and any material restrictions before travel or remote participation begins.

Core expectations

- Use written arrangements for significant joint programs, research placements and externally supervised academic work.
- Clarify which institution is responsible for assessment, supervision, safety, data management and complaint handling.
- Prepare students and staff for differences in professional norms while making clear that harassment, exploitation and unsafe conduct are not excused by cultural difference.
- Review cross-border data transfer and access to restricted systems before moving research materials.
- Provide an escalation route when a host supervisor or partner organization is itself the subject of concern.

Implementation and decision practice

Participants should understand insurance, travel, health, security and administrative requirements relevant to the activity. Where risk levels change materially, the University-side owner should reassess whether the activity should continue or be modified.

Control objective

Partnership quality includes how people are treated. Academic prestige or funding value should not prevent review of credible concerns about safety, integrity, discrimination or contractual non-compliance.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

Sustainability, Environment and Responsible Use of Resources

Engineering choices should consider long-term environmental and social effects

The University's mission in science and technology creates opportunities to model responsible resource use. Teaching, research and operations should consider energy, materials, waste, procurement, equipment lifecycle and the environmental consequences of technical choices. Sustainability should be integrated where it is relevant to learning outcomes and project design rather than treated only as a communications activity.

Core expectations

- Reduce unnecessary energy consumption, printing and material waste where this does not compromise safety or research validity.
- Handle electronic waste, batteries, chemicals and laboratory materials through appropriate collection and disposal routes.
- Consider durability, repairability, maintainability and lifecycle cost when selecting equipment for long-term use.
- Share expensive research infrastructure efficiently when governance, scheduling and safety conditions allow.
- Document environmental trade-offs when a project has significant resource, energy or deployment impacts.

Implementation and decision practice

Research groups should avoid overstating environmental benefits without evidence. Claims about energy efficiency, carbon reduction, sustainability or social impact should use transparent assumptions and comparable baselines. Likewise, procurement decisions should consider maintenance, training and end-of-life costs rather than only purchase price.

Control objective

Environmental responsibility should remain consistent with human safety and academic quality; waste reduction must not encourage unsafe reuse of materials or bypass necessary controls.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

23

Procurement, Service Providers and External Partners

Third-party relationships should not weaken standards that protect people and information

External service providers, vendors and partners may handle facilities, technology platforms, student data, research equipment, recruitment, events or specialized professional services. The University unit responsible for the relationship should consider whether the third party can meet relevant requirements for security, privacy, safety, confidentiality, accessibility and professional conduct. Contractual language should be proportionate to the risk and the value of the service.

Core expectations

- Identify what data, systems, facilities or groups of people the provider will access.
- Include clear confidentiality, security, incident-reporting and return-or-deletion expectations when sensitive information is involved.
- Require appropriate qualifications, supervision and safety controls for technical work on University premises or infrastructure.
- Avoid procurement decisions based solely on personal relationships or undisclosed interests.
- Provide a route for community members to report serious concerns about contractor or partner conduct.

Implementation and decision practice

Before adopting software-as-a-service platforms, units should understand data location, account ownership, access controls, export capability and what happens when the contract ends. For research equipment or specialized services, units should plan training, maintenance, calibration and support responsibilities.

Control objective

A partner's reputation or size does not remove the need for due diligence. Conversely, due diligence should be proportionate; low-risk purchases should not be burdened with the same controls as systems processing sensitive data or operating safety-critical equipment.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

Reporting, Complaints and Protection from Retaliation

Concerns should reach the right owner and receive a documented response

A policy is ineffective if people do not know where to raise concerns or believe that reporting will make their situation worse. UET units should maintain understandable routes for academic questions, safety reports, integrity concerns, discrimination or harassment complaints, data incidents, student-support issues and administrative grievances. The receiving person should confirm receipt, triage urgency and either take ownership or transfer the matter to the correct unit without losing accountability.

Core expectations

- Provide more than one reporting route for serious concerns where a conflict of interest may exist.
- Distinguish emergencies from routine complaints and activate urgent safety procedures when needed.
- Record the core allegation, relevant dates, immediate risks, responsible unit and next action.
- Limit disclosure to people who need the information for support, review, decision or legal obligations.
- Protect good-faith reporters and witnesses from retaliation, while allowing appropriate response to knowingly false or malicious allegations.

Implementation and decision practice

Anonymous reports may be considered when sufficient information exists to assess risk, but anonymity can limit the ability to verify facts or provide individual remedies. Units should explain these limitations without dismissing concerns automatically. People raising concerns should be told what type of process will follow and, where feasible, the expected timing of the next update.

Control objective

Reporting systems should be designed for learning as well as case resolution. Repeated complaints about the same process, laboratory, course or administrative bottleneck may indicate a structural problem even if no single case appears severe.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

25

Review, Investigation, Corrective Action and Appeal

Fair process requires impartial fact-finding and proportionate outcomes

When a complaint or incident requires formal review, the process should be defined, appropriately independent and proportionate to the seriousness of the matter. Reviewers should identify the questions to be answered, gather relevant evidence, allow affected persons a reasonable opportunity to respond and avoid treating allegations as proven before the process is complete. Confidentiality should be preserved to the extent compatible with fairness and safety.

Core expectations

- Use reviewers who do not have a material conflict of interest in the outcome.
- Preserve relevant documents, system logs, messages, assessment records, laboratory data or other evidence when loss is foreseeable.
- Separate interim protective measures from final findings; temporary measures should not be described as punishment.
- Base findings on documented evidence and the standard required by the applicable formal procedure.
- Match corrective action to the nature, severity, impact and recurrence of the issue, and provide appeal or review rights where the governing procedure provides them.

Implementation and decision practice

Corrective action can include clarification of expectations, training, process change, reassessment, access-control changes, supervision adjustments, safety remediation, restoration of academic opportunity or formal disciplinary action under applicable rules. The aim is both accountability and prevention of recurrence.

Control objective

A closed case should still produce institutional learning where appropriate. The responsible unit should ask whether unclear policy, weak training, poor system design or unmanaged workload contributed to the problem.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

26

Governance, Roles and Accountability

Responsibilities should be visible from University level to individual activity owners

Effective implementation requires named owners rather than general statements that “the University” is responsible. Senior leadership sets expectations and allocates resources; faculties and institutes translate them into academic practice; laboratories and project leaders manage local risks; administrative units operate support and record systems; and every community member has responsibilities for conduct, integrity and reporting. Governance should avoid both gaps and unnecessary duplication.

Core expectations

- Assign an accountable role for each major policy domain and publish contact routes through official channels.
- Define which decisions can be made locally and which require escalation to higher authority or specialist review.
- Maintain conflict-of-interest rules for committees, panels, recruitment, procurement, assessment and investigations.
- Ensure temporary or acting roles inherit the necessary responsibilities and access controls when personnel change.
- Use periodic management review to examine incidents, complaints, audit findings, unresolved actions and emerging risks.

Implementation and decision practice

Committees should have clear terms of reference, membership, decision authority, quorum where relevant, recordkeeping and confidentiality expectations. Decisions that affect individuals should identify the basis, responsible authority and route for clarification or review.

Control objective

Governance is strongest when it supports action at the correct level. Routine low-risk matters should be resolved efficiently, while high-risk or precedent-setting cases should receive appropriate senior or specialist oversight.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

27

Training, Communication and Awareness

People can comply only when expectations are understandable and available

Policies should be translated into role-relevant practice. A long document alone will not change behavior. New students and staff should receive orientation on core conduct, academic integrity, safety, digital security and support routes. Specialized roles require additional training: laboratory users need equipment and hazard instruction; supervisors need guidance on mentoring and conflict; researchers need ethics and data-management training; system administrators need stronger security controls.

Core expectations

- Use short, role-specific learning modules supported by deeper reference material.
- Refresh training when major rules, systems, technologies or risk profiles change.
- Keep important procedures in official channels and remove obsolete copies that can mislead users.
- Use realistic scenarios so people learn how to recognize boundary cases rather than memorizing slogans.
- Track completion when training is mandatory and define how non-completion is followed up.

Implementation and decision practice

Communication should be accessible and consistent. Important deadlines, procedural changes and safety instructions should not depend only on informal chat groups. Where urgent notifications are necessary, the message should identify the issuing unit, required action and a stable source for details.

Control objective

Awareness can be assessed through practical indicators such as recurring questions, incident patterns, audit findings and whether users can identify the correct reporting route. Training should be improved when evidence shows that a rule is misunderstood.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

Records, Document Control and Information Access

Reliable records make decisions explainable and policies usable

Academic and administrative decisions need records appropriate to their significance. Records support continuity when personnel change, allow appeals or audits to be handled fairly and reduce dependence on personal memory. At the same time, over-collection creates privacy and security risk. Units should therefore keep what is necessary, protect it appropriately and remove or archive information according to applicable retention requirements.

Core expectations

- Assign an owner, title, version or issue date to controlled policy and procedure documents.
- Keep official copies in stable University-managed locations rather than relying on personal drives or message attachments.
- Record material decisions, approvals and exceptions at a level sufficient to understand who decided what and why.
- Restrict sensitive case files, assessment materials and research records to authorized roles.
- Review outdated documents and clearly mark superseded material when immediate deletion is not appropriate.

Implementation and decision practice

Document control should include templates, forms and guidance as well as policies. A correct policy can still fail if users complete an obsolete form or follow a retired workflow. Links from student and staff portals should therefore be tested periodically and corrected when structures change.

Control objective

Access requests should be handled under the applicable rules for confidentiality, privacy, intellectual property and administrative records. Transparency does not require unrestricted public access to all information; it requires principled, explainable access decisions.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

29

Monitoring, Metrics and Continuous Improvement

Measure whether the framework is working, not only whether documents exist

Implementation should be reviewed using a balanced set of indicators. Counting training completion or published policies is useful but insufficient. The University should also examine whether incidents are resolved, whether repeated problems decrease, whether users can find support, whether safety controls are effective, and whether decision processes are timely and consistent. Metrics should avoid creating incentives to hide problems simply to make numbers look better.

Core expectations

- Track trends in complaints, appeals, safety incidents, near misses, data incidents and unresolved corrective actions.
- Review completion and effectiveness of mandatory training rather than relying only on attendance.
- Monitor timeliness for high-impact administrative and academic processes where delays can harm students or staff.
- Use surveys or structured feedback to identify barriers in learning, supervision, support and reporting routes.
- Document improvement actions, responsible owners, target dates and verification that the change was implemented.

Implementation and decision practice

A rise in reports can mean worsening behavior, improved trust in reporting systems, or both. Metrics therefore require interpretation. Units should combine quantitative indicators with case review and user feedback before drawing conclusions. Comparisons across faculties should account for differences in size, activity type and risk exposure.

Control objective

Annual review should identify a small number of priority improvements rather than producing a long list with no ownership. Progress should be visible to the responsible governance body and unresolved high-risk actions should remain open until verified.

MINIMUM STANDARD The responsible unit should be able to identify the applicable rule, the person accountable for the activity, the main evidence supporting important decisions, and the route for raising a concern when normal handling is not sufficient.

A

Case Scenarios and Expected Responses

Illustrative examples for training; not substitutes for formal procedures

The following scenarios illustrate how the framework can be applied without assuming that every case has the same answer. Actual cases require the formal procedure, evidence, responsible authority and context that apply at the time. The examples are written to support training in issue recognition, triage and proportionate response.

A1. Thesis supervision conflict

A student reports that a supervisor repeatedly changes thesis requirements verbally and later denies earlier instructions. The appropriate response is to preserve available records, clarify the current academic requirements in writing, identify whether the dispute concerns academic judgment or procedure, and provide an alternative academic contact if the supervision relationship has become unworkable. The aim is not to guarantee the student's preferred thesis outcome; it is to restore a transparent process and prevent retaliation.

A2. Generative AI and confidential research data

A research assistant wants to paste unpublished participant transcripts into a public AI service to generate summaries. The team should stop and assess data sensitivity, authorization, service terms, storage and whether de-identification is sufficient. If an approved environment is available, the use may proceed under defined controls. Convenience is not a sufficient reason to expose confidential research information.

A3. Laboratory near miss

A student bypasses a safety interlock to finish a test before a deadline. No injury occurs. The event should still be reported because the behavior and the deadline pressure reveal a serious control failure. The response may include stopping the experiment, reviewing supervision and scheduling, retraining users, checking equipment and clarifying consequences for bypassing safeguards.

A4. Group project exclusion

A project team removes one member from communication channels and later submits work without listing that person's documented technical contribution. The course owner should review contribution evidence, communication records and assessment rules. The academic response may require corrected contribution attribution and a separate conduct review if exclusion was deliberate or discriminatory.

A5. Scholarship selection concern

An applicant believes a scholarship was awarded through personal favoritism. The responsible unit should be able to show the eligibility criteria, panel process, conflict declarations and decision record without exposing unnecessary personal information about other applicants. If the process was not followed, corrective review should focus on restoring procedural fairness.

A6. Online harassment

A community member receives repeated insulting messages and edited images through a course discussion group. Administrators should preserve evidence, stop further distribution where possible, protect the affected person from retaliation and route the matter under the appropriate conduct process. The fact that messages occurred online does not remove institutional responsibility when the group is part of a University activity.

USE OF ANNEX These examples and checklists are generated implementation aids. They should be aligned with current official regulations, delegated authority and specialist advice before being used as a formal control document.

B

Implementation Checklist and RACI Guidance

A practical control set for faculties, laboratories, projects and administrative units

This checklist converts the policy principles into a manageable implementation workflow. A unit can use it during annual planning, project startup, laboratory review, course preparation or adoption of a new digital service. Items should be adapted to the unit's real authority and existing UET/VNU procedures.

B1. Policy ownership

Identify the unit leader accountable for implementation and the operational contact who maintains procedures, guidance and records.

B2. Risk mapping

List the activities in the unit that involve significant safety, personal data, vulnerable participants, high-stakes assessment, external partners, autonomous systems or sensitive research.

B3. Role assignment

For each risk area, define who is Responsible for day-to-day action, who is Accountable for the outcome, who must be Consulted before key decisions and who must be Informed. Avoid assigning all four roles to the same person for high-impact matters when independent review is feasible.

B4. Minimum evidence

Maintain the records necessary to show that required training, approvals, safety checks, consent, assessment moderation, incident response or corrective action occurred.

B5. Reporting routes

Publish at least one normal route and an alternative route for serious concerns involving a conflict of interest.

B6. Periodic review

At least once in the unit's normal planning cycle, review incidents, complaints, training gaps, stale documents and overdue corrective actions. Escalate unresolved high-risk items.

B7. Technology change

Before adopting a new platform, AI tool, dataset, laboratory system or external service, assess privacy, security, accessibility, licensing, vendor dependency and exit options.

B8. Communication

Keep the current procedure in an official location and remove or clearly mark outdated copies to reduce conflicting instructions.

USE OF ANNEX These examples and checklists are generated implementation aids. They should be aligned with current official regulations, delegated authority and specialist advice before being used as a formal control document.

C

Room, Classroom and Teaching-Space Management

Operational reference model for room records, class meetings, reservations and lifecycle control

UET teaching and research activities depend on physical spaces that are identifiable, schedulable, safe and supported by accurate operational data. This section defines a structured reference model for managing classrooms, seminar rooms, computer rooms, laboratories, project rooms and other teaching spaces. It is written so the same information can support administrative procedures as well as a software module that performs create, read, update and delete operations.

Public UET information confirms the use of multiple teaching locations, including Giang duong 3, the Kieu Mai teaching area and learning facilities at Hoa Lac. The room-level codes and sample records in this section are illustrative implementation data, not an assertion that each listed room number is an official UET designation.

C1. Objectives

- **Single source of truth:** each room has one canonical record and stable identifier even if its display name changes.
- **Scheduling integrity:** room capacity, room type, operating status and time conflicts are checked before a class or reservation is confirmed.
- **Operational accountability:** updates to capacity, equipment, safety restrictions and availability are traceable to an authorized actor.
- **Safe deletion:** historical teaching records are preserved. Rooms with dependent records are normally deactivated or archived rather than physically erased.
- **Interoperability:** room data should be reusable by timetable, student portal, facility maintenance, access control and reporting services.

C2. Core entities and relationships

Entity	Purpose	Key relationship
Building / Site	Groups rooms by physical teaching location.	One site contains many rooms.
Room	Canonical teaching-space record.	Belongs to one site; has many room-equipment and status records.
Class Section	A specific teaching instance of a subject in a term.	Has one or more scheduled meetings.
Class Meeting	Date/time pattern that assigns a class section to a room.	References one class section and normally one room.
Reservation	Temporary booking outside the normal timetable.	References a room, requester, purpose and time window.
Maintenance Event	Records defects, inspections, closures and restoration.	May temporarily block a room from scheduling.

IMPLEMENTATION NOTE The model separates **Room** from **Class**. A room describes a physical resource; a class describes an academic activity. Their connection occurs through a meeting or reservation, which makes conflict detection and history much easier.

C1 Canonical Room Record

Minimum data required for reliable room CRUD and downstream scheduling

Every teaching space should be represented by a stable internal identifier that is never recycled. Human-readable room codes may change because of renovation, building renaming or operational reorganization, but the internal identifier should remain constant so historical class and audit records still point to the correct resource.

C1.1 Mandatory and recommended fields

Field	Type / Example	Requirement and meaning
room_id	UUID or stable string	Primary key. Immutable after creation and never reused.
room_code	GD3-201	Unique display code used by staff and students.
room_name	Lecture Room 201	Optional descriptive name; should not be the primary key.
site_code	GD3 / KM / HL	References a recognized teaching site or building group.
floor	2	Floor or level; nullable for spaces without conventional floors.
room_type	LECTURE / LAB / SEMINAR	Controlled category used for suitability checks.
capacity	80	Maximum normal occupancy used by scheduling validation.
status	ACTIVE	ACTIVE, INACTIVE, MAINTENANCE, RESTRICTED or ARCHIVED.
accessible	true	Indicates baseline physical accessibility support.
has_projector	true	Convenience flag for frequently queried equipment.
notes	Free text	Operational note; should not contain confidential personal data.
created_at	Timestamp	System generated creation time.
updated_at	Timestamp	Updated on every material change.
version	Integer	Optimistic-lock version for safe concurrent updates.

C1.2 Identifier rules

- A room code must be unique among non-archived room records. Case and whitespace normalization should be applied before uniqueness is checked.
- The site component should be controlled by a site registry rather than arbitrary free text. This avoids duplicates such as different spellings of the same teaching location.
- Room codes should be short enough for timetable display but meaningful enough for people to recognize the location. The database identifier remains independent from the display code.
- Changing **room_code** is an update, not a delete-and-recreate operation. Historical references continue to use **room_id**.

C1.3 Status semantics

ACTIVE means the room may be scheduled if other constraints are satisfied. **INACTIVE** means it is currently not offered for normal scheduling. **MAINTENANCE** means the space is temporarily unavailable because of inspection or repair. **RESTRICTED** requires explicit authorization. **ARCHIVED** means the room is retained only for historical integrity.

DATA QUALITY RULE Capacity, room type and status are operational fields. They should not be changed casually because they directly affect timetable validation and user-facing availability.

C2

Room Types, Equipment and Scheduling Constraints

How a room becomes suitable - or unsuitable - for a specific class or activity

Capacity alone does not determine whether a room can host a class. A valid assignment also depends on teaching mode, installed equipment, accessibility, safety conditions, access restrictions and temporary maintenance state. These attributes should therefore be represented as structured data wherever they are frequently queried.

C2.1 Reference room types

Code	Type	Typical use	Additional constraints
LECTURE	Lecture room	Large or medium scheduled lectures.	Capacity, projector/display and seating layout.
SEMINAR	Seminar room	Discussion, tutorial and small-group teaching.	Flexible seating and moderate capacity.
COMPUTER_LAB	Computer laboratory	Programming, data and software practice.	Workstations, network, software image, power.
ELECTRONICS_LAB	Electronics laboratory	Circuit and embedded-system practice.	Bench equipment, supervision and safety controls.
ROBOTICS_LAB	Robotics / automation laboratory	Robot, control and mechatronics activities.	Restricted equipment zones and trained supervision.
PROJECT	Project room	Team project work and capstone activity.	Reservation rules and equipment checkout.
MEETING	Meeting room	Academic administration or project meetings.	Not normally used for high-capacity teaching.

C2.2 Equipment profile

Frequently queried equipment can be modeled with boolean fields for speed, while less common items should be represented in a child table such as **room_equipment(room_id, equipment_type, quantity, status, last_verified_at)**. This prevents the Room record from growing into dozens of rarely used columns.

Equipment attribute	Example	Scheduling effect
Presentation	Projector, large display, HDMI input	May be mandatory for lecture or defense sessions.
Computing	Student workstations, GPU workstations	Determines whether practical software classes can be assigned.
Network	Wired network, secure wireless, lab VLAN	Required for network or distributed-system exercises.
Audio / capture	Microphone, speakers, lecture capture	Useful for hybrid teaching or recorded sessions.
Lab equipment	Oscilloscope, FPGA kits, robot platforms	Can make the room restricted to approved courses.

C2.3 Constraint evaluation order

A scheduler should normally evaluate: **(1)** room status; **(2)** time overlap; **(3)** capacity; **(4)** room type; **(5)** required equipment; **(6)** access or safety restrictions; and **(7)** temporary maintenance blocks. A failure should return a concrete reason instead of a generic "room unavailable" message.

EXAMPLE A class of 72 students should not be assigned to a 60-seat room even if the room is otherwise free. A 90-seat electronics laboratory may still be unsuitable for a general lecture if laboratory access rules or equipment protection requirements restrict that use.

C3 Illustrative Room Registry

Synthetic room-level records designed for development, testing and CRUD demonstrations

The following records are intentionally illustrative. Site labels are aligned with public UET teaching-location information, while individual room codes, capacities and equipment profiles are sample data for system design and testing. They may be replaced with authoritative facility records during deployment.

room_code	site	type	cap.	status	selected equipment
GD3-101	GD3	LECTURE	120	ACTIVE	projector, microphone, capture
GD3-102	GD3	LECTURE	90	ACTIVE	projector, speakers
GD3-201	GD3	LECTURE	80	ACTIVE	projector, display
GD3-202	GD3	SEMINAR	48	ACTIVE	display, flexible seating
GD3-301	GD3	COMPUTER_LAB	42	ACTIVE	42 workstations, wired network
GD3-302	GD3	COMPUTER_LAB	36	MAINTENANCE	36 workstations, lab VLAN
GD3-401	GD3	PROJECT	28	ACTIVE	display, whiteboard
GD3-402	GD3	MEETING	16	ACTIVE	video conference
KM-101	KM	LECTURE	100	ACTIVE	projector, microphone
KM-102	KM	LECTURE	70	ACTIVE	projector, speakers
KM-201	KM	SEMINAR	40	ACTIVE	display, movable desks
KM-202	KM	COMPUTER_LAB	40	ACTIVE	40 workstations, wired network
KM-301	KM	ELECTRONICS_LAB	32	RESTRICTED	oscilloscopes, bench supplies
KM-302	KM	PROJECT	24	ACTIVE	whiteboards, team tables
HL-A101	HL	LECTURE	150	ACTIVE	projector, microphone, capture
HL-A102	HL	LECTURE	120	ACTIVE	dual display, microphone
HL-A201	HL	SEMINAR	54	ACTIVE	display, flexible seating
HL-A301	HL	COMPUTER_LAB	48	ACTIVE	48 workstations, lab network
HL-B101	HL	ELECTRONICS_LAB	36	ACTIVE	bench supplies, instruments
HL-B201	HL	ROBOTICS_LAB	30	RESTRICTED	robot platforms, safety zone
HL-B202	HL	ROBOTICS_LAB	24	MAINTENANCE	automation cells
HL-C101	HL	PROJECT	36	ACTIVE	team tables, display
HL-C102	HL	PROJECT	24	ACTIVE	whiteboards, storage
HL-C201	HL	MEETING	18	ACTIVE	video conference

C3.1 Example read views

- **Room detail:** returns the canonical record plus current equipment summary, next reservations, maintenance blocks and active class meetings.
- **Availability search:** filters by site, date/time, minimum capacity, room type, equipment and accessibility needs.
- **Operational dashboard:** groups rooms by ACTIVE, MAINTENANCE, RESTRICTED and INACTIVE states and highlights stale verification dates.
- **Timetable view:** shows confirmed class meetings by week while excluding archived room records from new assignments.

TESTING VALUE A mixed dataset with active, restricted and maintenance rooms is more useful for CRUD testing than a list in which every record is identical. It allows validation of conflict messages, filtering and state transitions.

C4 Class Section and Class Meeting Model

Separating academic identity from recurring room assignments

A class should not store a single room directly if it meets more than once or may move during a term. Instead, the academic class section is the parent record and individual meeting patterns connect it to rooms. This supports hybrid classes, temporary room changes, make-up sessions and one-off examination arrangements without corrupting the class identity.

C4.1 Class section fields

Field	Example	Meaning
class_id	CLS-2026F-001	Stable identifier for one section in one academic term.
class_code	INT-AI-01	Human-readable section code; unique within a term.
course_title	Introduction to Artificial Intelligence	Displayed academic subject title.
term_code	2026-FALL	Academic term reference.
instructor_ref	USR-1042	Reference to authorized teaching staff record.
expected_size	78	Expected enrollment used by room-capacity checks.
delivery_mode	IN_PERSON	IN_PERSON, HYBRID or ONLINE; influences room requirement.
class_status	OPEN	DRAFT, OPEN, ACTIVE, COMPLETED, CANCELLED or ARCHIVED.

C4.2 Class meeting fields

Field	Example	Validation
meeting_id	MTG-001	Immutable primary key.
class_id	CLS-2026F-001	Must reference an existing class section.
room_id	room UUID for GD3-201	Required for in-person meeting unless explicitly unassigned.
day_of_week	MON	Controlled value for recurring meetings.
start_time / end_time	09:00 / 10:50	Start must precede end; slot must follow timetable rules.
effective_from / to	2026-09-07 / 2026-12-18	Defines recurrence window.
meeting_type	LECTURE	LECTURE, PRACTICAL, TUTORIAL, EXAM or MAKEUP.
status	CONFIRMED	DRAFT, CONFIRMED, CANCELLED or COMPLETED.

C4.3 Relationship rules

- Deleting a class section must not silently remove completed meeting history. A class with historical activity should be archived or cancelled and retained.
- A room may host many meetings over a term, but no two confirmed meetings may overlap in the same room unless the institution explicitly supports a shared-space exception.
- A room change updates or replaces the affected meeting assignment; it does not create a new class identity.

DESIGN PRINCIPLE Room availability is a function of time. Therefore, room assignment belongs to a meeting or reservation record rather than to the room or class record by itself.

C5

Illustrative Class and Timetable Dataset

Synthetic class records that exercise capacity, type, maintenance and conflict rules

These examples are designed for development and testing. Course titles and codes are illustrative and should be replaced by authoritative training data in production.

class_code	course / activity	size	meeting	room	state
AI-01	Introduction to Artificial Intelligence	78	Mon 09:00-10:50	GD3-201	CONFIRMED
AI-02	Introduction to Artificial Intelligence	44	Tue 13:00-14:50	KM-201	DRAFT
SE-01	Software Engineering	88	Wed 09:00-10:50	GD3-102	CONFIRMED
DSA-01	Data Structures and Algorithms	118	Thu 07:00-08:50	GD3-101	CONFIRMED
DB-01	Database Systems	38	Fri 13:00-15:50	KM-202	CONFIRMED
NET-01	Computer Networks Lab	34	Tue 09:00-11:50	GD3-301	CONFIRMED
EMB-01	Embedded Systems Practice	30	Wed 13:00-15:50	KM-301	CONFIRMED
ROB-01	Robotics Laboratory	26	Thu 13:00-15:50	HL-B201	CONFIRMED
ML-01	Machine Learning	116	Fri 09:00-10:50	HL-A102	CONFIRMED
HCI-01	Human-Computer Interaction	50	Mon 13:00-14:50	HL-A201	CONFIRMED
CAP-01	Capstone Project Studio	32	Sat 08:00-11:50	HL-C101	CONFIRMED
SEM-01	Research Seminar	22	Fri 15:00-16:50	KM-302	CONFIRMED
ADM-01	Academic Coordination Meeting	14	Wed 16:00-17:00	HL-C201	CONFIRMED
AI-01-L	AI Practical Session	40	Thu 09:00-11:50	HL-A301	CONFIRMED
ELEC-01	Digital Electronics Practice	32	Fri 13:00-15:50	HL-B101	CONFIRMED

C5.1 Validation examples

- **Capacity rejection:** assigning DSA-01 with expected size 118 to GD3-201 with capacity 80 must fail before confirmation.
- **Maintenance rejection:** a new meeting cannot be confirmed in GD3-302 while its room status is MAINTENANCE.
- **Restricted-room authorization:** EMB-01 may use KM-301 only if the class purpose and responsible staff satisfy the laboratory access rule.
- **Time conflict:** a second confirmed meeting in HL-A102 on Friday 09:30-10:30 overlaps ML-01 and must be rejected or routed to a conflict-resolution process.
- **Draft flexibility:** DRAFT meetings may temporarily contain incomplete assignments, but they should not be presented to students as final timetable data.

C5.2 Read models useful for an application

The system may expose different read views without duplicating the source data: **class schedule** grouped by class; **room schedule** grouped by room; **available rooms** for a requested time window; and **conflict report** listing capacity, equipment, status or overlap violations.

CONSISTENCY RULE A confirmed class meeting should become visible to student-facing timetable services only after the room assignment passes all required validations.

C6

CRUD Operations for Rooms and Classes

Operational behavior expected from create, read, update and delete actions

C6.1 Create Room

Creation should validate that the site exists, the room code is unique, capacity is a positive integer, room type is recognized and initial status is permitted. The system should generate the immutable **room_id**, creation timestamp and first audit event. Equipment details may be created in the same transaction when supplied.

C6.2 Read Room

A room detail query should return the current canonical fields and may include derived information such as current availability, active class meetings, upcoming reservations, equipment status and open maintenance events. List queries should support filtering by site, type, capacity range, status and equipment without requiring the caller to download the full registry.

C6.3 Update Room

Updates should be partial and field-aware. Changing a descriptive note is low risk; changing capacity, room type or status can invalidate future assignments. Before committing those changes, the service should identify affected meetings and either reject the update, require an explicit override workflow or mark impacted assignments for review. Concurrency should be controlled with a version number or equivalent optimistic-lock mechanism.

C6.4 Delete Room

Physical deletion should be rare. If the room has no dependent records and was created in error, hard deletion may be permitted to an authorized administrator. Otherwise, the safer action is **archive**: the room becomes unavailable for new scheduling while all historical classes, reservations and maintenance records remain queryable.

C6.5 Create and update Class

Creating a class section establishes its academic identity. Meetings may then be added separately. Changes to expected class size should trigger a re-check of confirmed room capacity. A class cancellation should cancel future meetings without destroying historical events or attendance-related references.

C6.6 Delete Class

A class that has never been published and has no downstream records may be hard-deleted under controlled conditions. A published, active or completed class should instead transition to CANCELLED or ARCHIVED. This preserves traceability and avoids broken references in student, timetable or reporting services.

C6.7 Transaction boundaries

- Create or update operations that affect both a room assignment and a meeting should succeed atomically or fail atomically.
- Conflict checks should be performed against the latest committed timetable inside the same transaction boundary where feasible.
- Audit events should be written as part of the successful transaction so the business change cannot exist without its trace record.

SOFT DELETE DEFAULT For operational university data, "delete" should usually mean archive or deactivate. Hard delete is appropriate mainly for erroneous, unreferenced draft records.

C7

Validation, Reservations, Maintenance and Audit

Rules that keep room CRUD safe when several services change the same resources

C7.1 Reservation workflow

A reservation request identifies room or search criteria, requester, purpose, start and end times, expected attendance and any equipment requirements. Confirmation requires the same time-overlap and room-suitability checks used for classes. Administrative or laboratory spaces may require approval before the reservation becomes CONFIRMED.

C7.2 Maintenance blocks

Maintenance should be modeled as a time-bounded operational record rather than only a free-text note. A maintenance event may set the entire room to MAINTENANCE or block specific time windows. When emergency closure affects already confirmed classes, the system should generate an impact list for reassignment rather than silently cancelling meetings.

C7.3 Core invariants

Invariant	Expected behavior
No overlap	Two confirmed room occupancies cannot intersect in time unless an explicit sharing rule applies.
Capacity	expected_size must be less than or equal to room capacity for confirmed in-person meetings.
Status	INACTIVE, MAINTENANCE and ARCHIVED rooms cannot receive new normal bookings.
Type suitability	Practical laboratory meetings may require a compatible laboratory room type.
Referential integrity	Meeting.room_id and Meeting.class_id must reference valid parent records.
Historical integrity	Deleting or archiving a parent must not orphan past meetings or audit events.
Uniqueness	Normalized room_code is unique among current room records.

C7.4 Audit event

Every material change should record **event_id**, **actor_ref**, **action**, **entity_type**, **entity_id**, **timestamp**, **before_summary**, **after_summary**, **reason** and a correlation identifier when the request crosses several services. Sensitive personal data should not be copied into audit text unless required.

C7.5 Authorization model

- **Viewer:** can read room registry and published schedules.
- **Scheduler:** can create and update class meetings and reservations but cannot change structural room attributes.
- **Facility administrator:** can maintain room capacity, type, equipment and maintenance state.
- **System administrator:** manages technical configuration and exceptional recovery actions; this role should not automatically imply academic scheduling authority.

SECURITY PRINCIPLE Authorization should follow capability and responsibility. A user who can schedule a class should not automatically be allowed to alter room capacity or erase room history.

s

Source Basis, Document Control and Adoption Notes

Public institutional facts used to ground this generated draft and the room-management extension

The institutional facts in this document were checked against public UET sources available in September 2026. Public sources support the University identity, mission, student-facing information and the existence of teaching locations. The detailed room codes, capacities, class examples and CRUD rules in Section C are generated reference data for system design and do not claim to be official UET room inventory or timetable records.

Document control

- **Document title:** Human Rights & Academic Community Policy - Extended Reference Framework.
- **Status:** Generated draft for demonstration, discussion, policy design and software-data modeling purposes.
- **Version:** 2.1 extended edition, prepared 26-Sep-2026.
- **Room/class extension:** adds canonical room data, sample registry, class-meeting model, CRUD behavior, validation, reservation, maintenance and audit guidance.
- **Adoption requirement:** before formal operational use, validate the room registry, teaching-site identifiers, authority roles and timetable rules against current official UET/VNU systems and procedures.

FINAL NOTE The room and class records in this extension are intentionally suitable for backend CRUD development and test scenarios. They should be replaced or synchronized with authoritative institutional data before production use.
